Low-Pressure Gear Pumps ZPG

Application

In general the low-pressure gear pumps ZPG are intended for delivery of liquids with lubricating capacity without content of mechanical abrasive solids.

Max. temperature of pumped liquid	80 °C
Max. delivery pressure of pump	6 bar

Above all these pumps are available for pumping all kinds of oils, petroleum, diluents, emulsions, suds, molasses, tars, lyes, varnishes, soluble glass, etc.

They are also applicable for lubricating and cooling systems of various machines and aquipments, for low-pressure hydraulic drives, etc.

Design

Gear pumps ZPG are of horizontal foot-mounted type with external gearing.

Gear wheels are fastly gripped on shafts, which are on their other side supported on bearing bushes lubricated by a liquid being delivered. Rotor relieving from radial forces and a stuffing box relieving from a liquid pressure may be gained by realization of interior modifications conformed to working conditions of the pump.

Stuffing box with cord packing prevents penetration of a liquid being pumped around the driving shaft.

Safety devices

Pumps ZPG are provided with a relief valve, that - with exceeding of nominal resp. maximal pressures - should transfer a liquid being delivered back to the suction space through an internal passage provided in the pump casing.

Drive

On principle, it is of a direct type with transfer of torsional moment (T.D.) through a flexible coupling. Pumps are delivered equipped with very usual types of electric motors on common bed plates as the pump-set of a standard type.

With lower speed drives there are reduction gearedmotors used or a special gearbox palced between the motor and the pump.

Sense of rotation

Standard workmanship of pumps is **clockwise**, viewing from the drive side.

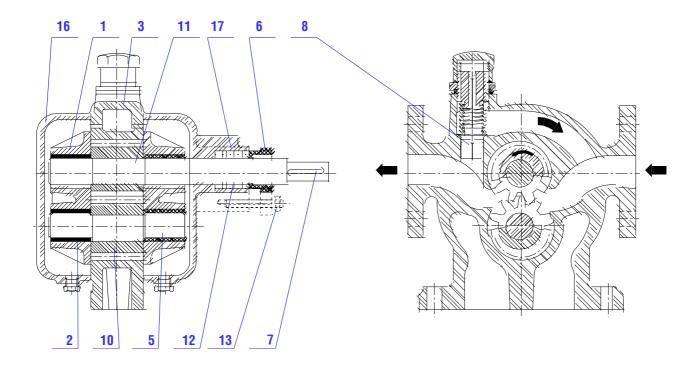

On a special application pumps may be supplied as counterclockwise ones, but with reverse direction of delivered liquid. It is not possible to use same pump in both direction of rotation.

Materials

Material version designated as "LO" may be considered as a standard one, with main parts from following materials:

- pump casing, shields/covers, stuffing box housing are from grey cast iron;
- gear wheels and shafts are from carbon steel;
- bearing bushes are from carbon steel with bronze lining.

Informative Pump Section - with mechanical seal

- 1. Shield
- 2. Bearing bush
- 3. Pump casing
- 5. Driven shaft
- 6. Gland
- 7. Coupling key8. Realief valve

- 10. Gear wheel
- 11. Drive shaft
- 12. Gland packing
- 13. Stuffing box screw
- 16. Cover
- 17. Stuffing box housing

Q..... pump capacitz

Speed selection

In general it is true:

- lower speed should be selected for liquids with higher viscosity and lower lubricating capacity and with longer operation of numps:
- higher speed should be selected for diluted liquids with low visconsity and good lubricating capacity, especially with max. delivery pressure of the pump application.

Speed range for various liquids according to the pump size and pressure is as follows:

max. 1,000 min⁻¹ for common lubricating and cooling oils and other diluted self-lubricating liquids with viscosity ranging from 304 to 76 mm².s⁻¹ - in sequence from the smallest to the greatest pump types;

max. 750 min⁻¹ for thicker self-lubricating liquids up to viscosity ranging from 1,140 up to 228 mm².s⁻¹ - the sequence is the same as with speed 1,000 min⁻¹;

max. 500 min⁻¹ ror heavy oils, tar, molasses, varnishes and other liquids with higher viscosity - the sequence is the same as with speed 1,000 min⁻¹.

P pump power required

^{*)} For heavy working conditions there is speed selection limited to max. 720 min⁻¹ - type ZPG-7 and to max. 500 min⁻¹ - type ZPG-10.

Q..... pump capacity

P pump power required

^{*)} For heavy working conditions there is speed selection limited to max. 700 min⁻¹ - type ZPG-7 and to max. 500 min⁻¹ - type ZPG-10.

Low-Pressure Gear Pumps ZPG
